

PRO

CON

The constants in the universe (gravity, electromagnetic force, weak force) are not determined by nature, they determine nature

There could be another universe with different constants

If so, this universe could never "know" it, and we have no evidence of it

Quantum mechanics states that all possible states do exist, therefore infinite number of constants and universes exist

Only a universe defined by consciousness can exist. The others are only possibilities

So other universes do exist in alternate consciousness

Only a universe capable of life (extract energy from environment, grow, adapt, reproduce) could be counted. Statistical probabilities don't count

No it is not arbitrary. The universe cannot have an explanation

Evolution of Life anywhere in the universe depends upon the design of the initial cosmic conditions

Different life could come from different conditions

There are no other verifiable and scientific conditions. Requiring some to exist is an act of belief in myth
